last formatted: November 12, 2026

1. Array class

Arrays:

```
1 #include <array>
2 std::array<int,5> fiveints;
```

- Size known at compile time.
- Vector methods that do not affect storage:
  yes `size`,`front`, no `push_back`,`insert`
- Zero overhead from allocation.

2. Array initialization

With template parameters:

```
1 array<int,3> i3 = {1,2,3};
2 // or
3 array<int,3> i3 { {1,2,3} };
4 // or
5 array<int,3> i3{1,2,3};
```

With C++17 template argument deduction:

```
1 array i3 = {1,2,3};
2 // Note: DOES NOT COMPILE:
3 array not4{1.5,2,3,4};
```
